

Project Design Phase

Solution Architecture

Date	28 June 2026
Name	Kavyasri Meghana karunakaram
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

Solution Architecture

The **Automated Network Request Management in ServiceNow** solution is developed using core ServiceNow components such as the **Service Catalog**, **Flow Designer**, **Approval Workflow**, and the **Network Request Database**. Users submit network requests through a self-service portal, where the system captures and validates the required details. A request record is then created and automatically forwarded to the designated approver. Once approved, the request is assigned to the appropriate IT support team for processing. Throughout the workflow, users receive email notifications about request updates, while all request information and status changes are stored in the database. This architecture ensures an efficient, transparent, and automated approach to managing network service requests.
